

IP-SAKTI SAHAYAK

Family 3 — Aloe / Aloe vera

Objective: Build a TKDL-only plant-family cluster for the alternative-plant discovery feature. The anchor is Aloe vera; the system can compare other TKDL-listed Aloe entries before suggesting a candidate for further research.

Strict TKDL rule: The official TKDL plant-name index publicly verifies three Aloe entries: Aloe barbadensis, Aloe perryi and Aloe succotrina. Therefore this dataset intentionally contains **2 related species** rather than inventing additional family members from outside TKDL.

Taxonomy caution: TKDL public examination records may use older family terminology (for example, Liliaceae for Aloe barbadensis). IP-SAKTI should preserve the family terminology used in the underlying TKDL record and separately store a standardized taxonomy only when independently verified. Do not infer legal equivalence from family membership.

1. Anchor plant

Aloe vera — Aloe barbadensis Mill.

TKDL Ayurvedic name: *kumār*; Unani name: Sibr/Gheekawaar. Common names shown by TKDL include Barbedos aloe, Indian aloe, Curacao aloe and Jaffarabad aloe.

2. Related TKDL species

Plant	Relationship	Prototype similarity	Evidence
Aloe perryi Bak.	Same Aloe genus	HIGH — 0.85	Official TKDL plant-name index; specific formulation similarity not established from reviewed public record
Aloe succotrina	Same Aloe genus	HIGH — 0.85	Official TKDL plant-name index; specific formulation similarity not established from reviewed public record

Similarity score is a prototype ranking value, not scientific equivalence, patentability, or freedom-to-operate.

3. TKDL-supported traditional-use / formulation evidence for Aloe barbadensis

EP1927361 / EPO: TKDL third-party observations cited Aloe barbadensis (Aloe vera) for obesity from multiple Ayurveda and Unani sources. The EPO examiner stated that the TKDL exhibits concerned oral formulations comprising Aloe vera extracts for obesity and considered them novelty-destroying for specified claims. Examination was reported as still in process.

Official TKDL record: <https://www.tkdل.res.in/tkdل/langdefault/common/Examinarreport/reports/EP1927361.asp>

EP1795200 / EPO: TKDL submitted evidence that Aloe barbadensis was traditionally used for diabetes mellitus. The EPO report identified TKDL documents disclosing compositions/use of Aloe barbadensis for diabetes and raised novelty/inventive-step concerns; the applicant subsequently amended claims.

Official TKDL record: <https://www.tkdل.res.in/tkdل/langdefault/common/Examinarreport/reports/EP1795200.asp>

EP1863498 / EPO: TKDL references included Aloe barbadensis for bronchial asthma, urticaria, rhinitis, nausea, duodenal ulcer, hyperacidity, nervous-system diseases, inflammation and vomiting/emesis. The record lists multiple formulation examples containing Aloe barbadensis, including a single-ingredient formulation for bronchial asthma. The EPO examiner stated that the cited traditional knowledge affected novelty/inventive step; the application was later deemed withdrawn.

Official TKDL record: <https://www.tkdل.res.in/tkdل/langdefault/common/Examinarreport/reports/EP1863498.asp>

4913/CHENP/2007: The CGPDTM examination record reports seven TKDL formulations containing Aloe barbadensis for obesity and states that the application was refused after consideration of the TKDL prior-art evidence.

Official TKDL record: https://www.tkdل.res.in/tkdل/langdefault/common/Examinarreport/reports/4913_CHENP_2007.asp

6415/DELNP/2007: The TKDL examination material lists Aloe barbadensis leaf in a multi-ingredient formulation associated with ulcer/wound-related use, alongside other plants. This is useful as a formulation-level seed record.

Official TKDL record: https://www.tkdل.res.in/tkdل/langdefault/common/Examinarreport/reports/6415_DELNP_2007.asp

4. Alternative-ranking logic

Candidate 1: Aloe perryi — start high because it is the same genus as the anchor. Increase its ranking only if a specific TKDL record demonstrates overlap in plant part, indication or formulation role.

Candidate 2: Aloe succotrina — same logic. Same-genus proximity is a screening signal, not proof that it can substitute for Aloe barbadensis.

5. Model-ready schema

family | anchor_plant | candidate_plant | botanical_name | TKDL_names/synonyms | plant_part | traditional_use | formulation | formulation_role | source_text | TKDL_case_id | official_TKDL_url | similarity_score | similarity_reasons | patent_IP_flag |

6. AI guardrails

- Never state “no legal barrier” merely because two plants are in the same family/genus.
- Never treat a TKDL appearance as proof that an ingredient is unpatentable.
- Separate traditional-knowledge evidence, novelty, inventive step and Section 3(p).
- Show the exact TKDL record behind an IP warning or recommendation.
- Recommended output: **“Potential alternative candidate — requires botanical, formulation, efficacy and patent/legal verification.”**

7. Official TKDL source

TKDL official plant-name index: <https://www.tkdل.res.in/tkdل/لangdefault/common/Utility/Keyword/Plant-Name.asp>

The index explicitly lists Aloe barbadensis Mill., Aloe perryi Bak. and Aloe succotrina. █cite█turn0search0█

The public EPO/CGPDTM records above demonstrate how Aloe barbadensis has appeared in TKDL-supported patent examination contexts. █cite█turn1search0█turn1search1█turn1search2█turn1search4█
